Token Entropy Heatmap

There are n values of x in the interval $0 < x < 2\pi$ where $f(x) = \sin(7\pi \cdot \sin(5x)) = 0$. For t of these n values of x , the graph of $y = f(x)$ is tangent to the x -axis. Find $n+t$.

C

Token-level entropy is inherently noisy!

But actually, when k is between -7 and 7 , but not all of them will lead to solutions? Wait, no. Since $\sin(5x)$ can take any value between -1 and 1 , so for any k between -7 and 7 , as long as k is integer, $k/7$ is in $[-1, 1]$, so all those k are valid. So there are 15 different equations $\sin(5x) = k/7$ for k from -7 to 7 . But some of these equations might have the same number of solutions. Wait, but actually, for each k except when $k/7$ is exactly ± 1 , the equation $\sin(\theta) = c$ has two solutions per period. Let me think step by step.
